

Installation Guidelines

- ☀ Solar collectors, whenever possible, should be installed on the plane of the roof material (flush mounted).
- ☀ Aluminum trim, if used and visible, should be anodized or otherwise color treated.
- ☀ All exterior plumbing lines should be painted in a color scheme which matches as closely as possible the color of the structure and materials adjacent to the pipes (i.e., pipes on walls should be painted the color of the walls while roof plumbing should be the color of the roof).
- ☀ Panel material should be dark in color.
- ☀ A sample or illustrated brochure of the proposed solar unit should be submitted with the application, which clearly depicts the unit and defines the materials to be used in the installation.
- ☀ Construction drawings for the proposed installation should be provided. They should be drawn to show the location and number of collectors, method of attachment to the roof structure, and location of any other exterior system components. A system approval, issued by an authorized rating organization (such as SRCC or FSEC) also should be provided.
- ☀ Solar units not mounted on the roof (ground mounted) should be installed according to the local jurisdiction's zoning "setback" requirements. Any such structure should be concealed from the neighbors' view when reasonably possible, and be free of all future likelihood of shading from fences, trees, shrubbery and other vegetation on the property and neighboring properties.
